In this article we will have an understanding of dental prostheses and their types, non-removable and removable prostheses,

Keywords: Prosthesis, dental procedures, one crown, bridge prosthesis, artificial structures.

INTRODUCTION

Remember that dentures have several basic types: removable and non-removable. In addition, there are significant differences between them. First of all, structures that are not suitable for spoiling are installed on the teeth only by the dentist for a certain period of time. Modern dentistry works great. However, keeping teeth in old age is not so easy. In any case, prostheses are needed. At the moment, there is a wide range of products. But, nevertheless, many do not know which dental procedures are best. The opinions of dentists indicate that each quandary has its own specificity and, of course, disadvantages of a particular product. All this must be taken into account in the process of selecting the material

TYPES OF DENTURES

To answer the question of how to put dental procedures better, several factors must be taken into account. This is very important. First of all, the construction should not be partial, but completely restore the function of lost teeth.

In addition, the choice of the prosthetic method depends on financial capabilities and should also be based on the intended goals. First, you need to understand what prostheses are available. It is better to help determine the dentist.

The main types of dentures:

Metal. Usually, they are made of steel or gold.

Metal ceramics.

Together. In this case, the prosthesis can be made of plastic on the front and metal on the back.

Ceramics.

It should be noted that prostheses are made not only from different materials, but also from different also listed in the forms. They can be done as follows:

A crown.

Bridge prosthesis.

Artificial structures.

Which dental prostheses are considered the best is not so simple. Different varieties have their own uniqueness and originality. The main difference depends not only on the cost of finished structures, but also on aesthetic qualities. Remember that

dentures have several basic types: removable and non-removable. In addition, there are significant differences between them. First of all, structures that are not suitable for spoiling are installed on the teeth only by the dentist for a certain period of time.

Which can be removed prosthesis is better to put

First of all, it is necessary to determine which orthopedic system is needed. The structures that can be removed are divided into several main groups. They are

among:

- Conditionally removable;
- Partially removable;
- Fully removable.

The assortment of such products is huge, and when choosing a design

it is necessary to listen to the opinion of experts. Specific of the above types of prostheses

there are features. The choice of a particular orthopedic design depends on how many of all healthy teeth are in the oral cavity. In this case, the product should fully fulfill its functions and not feel uncomfortable

What are the best removable dentures?

Removable structures are prostheses that the patient can independently remove from the oral cavity for hygiene and self-cleaning of the prosthesis. Find out which removable dentures are best in this category.

What is the best prosthesis for missing teeth?

Previously, patients who could not install implants for one reason or another had to endure very uncomfortable hard plastic prostheses. Today, there are modern designs on the market that practically do not cause inconvenience to their owner.

Many people are also looking for the best removable dentures for the upper jaw, because when restoring teeth in the upper jaw, it is especially important to fix the structure well so that the prosthesis does not fall out in the most unexpected cases. Installation of a full prosthesis with high-quality non-removable (conditionally removable) is not complete without implantation.

Prostheses with clamps and plates

The best prostheses of this type are nylon and acrylic structures that mimic the part of the tooth on both sides of the jaw. These are called plate prostheses. There are designs with metal arches (clasp prostheses) that are less useful and possible in terms of aesthetics. A spherical support is installed on each implanted implant, which is fixed to the prosthesis using special locks. It is also considered an excellent option, but in terms of reliability, slightly lower than beam structures-implants are also placed on the bone, so the volume of bone tissue is as important here as in standard implants. In this case, only removable structures are suitable for prosthetics, since mini-implants are used as a temporary option and cannot carry a more serious load: removable full prostheses completely model the jaw and Palatine part. There are many models on the market today, but the new generation of acrylic and nylon prostheses is the most modern. learn more about modern types of prosthetics by calling the clinic.

Which prosthetic material serves best and lasts longer?

The prosthetic material has the greatest impact on wearing comfort, and this is especially true for removable systems. If, although no mistakes were made in the manufacture of the structure itself, but the prosthesis still causes significant discomfort, then the matter is not in high-quality material.

Of course, no such system can provide one hundred percent comfort (especially at the stage of getting used to it), but modern materials achieve very high performance. So, what properties should the best materials for prostheses have:

Hypoallergenic. Many people are allergic to plastic and acrylic. "Friendly" for gums. If the prosthesis rubs the gums hard, wearing it will be a complete pain.

Color strength. Acceptable strength resistant to painting and environmental influences. Despite the fact that a removable prosthesis rarely lasts more than 5-6 years, the design should not be too fragile.

CONCLUSION: if we talk about specific brands of removable dentures, the best acrylic prosthesis is Acry-free ("Akri-free") made of non-acrylic plastic: it is very comfortable, does not shrink when worn, does not leave stains and does not cause appearance. allergy. Currently, the best nylon prostheses are the Quattro Ti brand. However, Quadrotti has limitations for use: to install them, one of the jaws must have several healthy teeth, but like other clamping prostheses. As for non-removable systems, metal-free structures that

look aesthetically pleasing, do not cause allergies, but are less durable are increasingly used here.
